

TRIXTER VR

The Trixter combines the best of both a Spin Cycle because it uses a Chain Drive and has the feeling of a road style bike, and Electronically controlled resistance to change gears just like you would do with a road cycle. The resistance is changed with button on the handlebars with a (+) and a (-) indicator.

They use the electronic controlled resistance in the software also. So when you go up a hill, the resistance will automatically change to simulate going up a hill, down a hill, through a sand trap, through a water puddle, etc.

TRIXTER VR

FEATURES

- VR Headset ready for immersive 360 degrees experience (optional)
- Single user & multiplayer options for local and worldwide racing
- Freedom to explore the virtual environments by going off track
- Analytics for gym owner with detailed monthly reports from bike usage
