What did PLC do today?

Today I did the following Round 2 application(s):

_____ Spring/Summer Weed Control (SP2) : This application controls any remaining broadleaf or grassy weeds that may be present and extends the pre-emergent barrier against summertime weeds. Application includes nutgrass control and spot treatment for other difficult to control weeds.

_____ Spring Fertilization (F1)*: Our first fertilization of the year encourages strong growth to help your lawn thrive through the summer and promotes that healthy green color we all love.

What to do Next

- Wait 24-72 hours and (if it hasn't rained) water up to **30 min** in each area. Watering moves the fertilizer and pre-emergent into the soil where they are most effective.
- Mow 5-10 days after application. If it hasn't rained, **BE SURE** you water before you mow! If watering is not possible, **MULCH** clippings.

* Fertilization Notice—Please Read

Again we are using a liquid fertilizer in the place of the traditional pellets. After thoroughly researching the options, we feel that the liquid fertilizer will provide each homeowner with the same long term, vigorous results as pellets.

Because it is a liquid, you will **not** see pellets in your lawn, on sidewalks or driveways (which is another benefit of the liquid fertilizer).

If you have any questions please contact our office (901) 829-4200

Thank you for the opportunity to service your lawn. If you have any questions please do not hesitate to ask. Contact the office at 829-4200 or email at ContactUs@PersonalLawnCare.com.

Fireweed - the Pesky Springtime Weed

Fireweed is a pesky little weed that is very common in spring and early summer and often dies out when the heat arrives. Like tree seedlings, fireweed germinates in the thatch layer which is above the pre-emergent. It is easily controlled by post-emergent weed treatments. Reducing thatch by de-thatching, aeration or by bagging clippings can also help reduce these invaders.

Zoysia Fungus Control Applications

There are several different funguses we commonly see in the mid-south, most (but not all) affect Zoysiagrass.

If you have Zoysia we highly recommend two preventative fungicide applications each year (one spring and one fall).

To further reduce stress on the turf, we add a surface insect control, Zoysia mite control, and a season long grub control product to the application.

This is equivalent to using bathroom cleaner on your shower **before** it starts "growing".

Treating fungus diseases before damage has begun will be significantly less cost and headache then treating a full outbreak.

Please Note:

IF YOUR LAWN RECEIVED A FUNGICIDE TREATMENT **THIS** SPRING, YOU ARE ALREADY SCHEDULED FOR YOUR APPLICATION AGAIN IN THE FALL.

IF YOU DO NOT WANT THE FUNGICIDE APPLICATION, YOU MUST CONTACT OUR OFFICE AS SOON AS POSSIBLE.

For specific Zoysia disease information visit our website: www.personallawn care.com
