

About Solar Heating Units from Quality Eco Technologies:

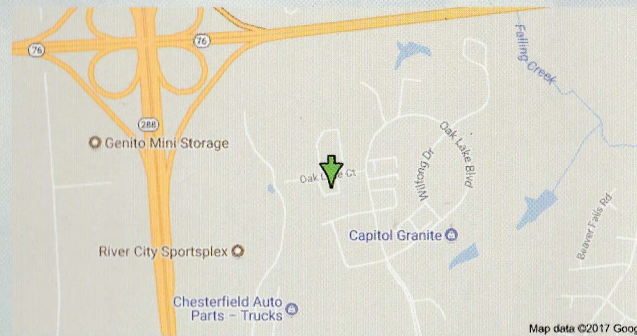

Solar air Heating is recognized as one of the most economical ways to heat a home using the sun's energy. Payback for solar air heating is 2-5 years, and that is before the federal tax credit of 30%!

Unlike Solar Thermal Heating applications, solar air heaters do not overheat in the summer months. In the summer time, simply adjust the temperature settings below the actual internal temperature, and your solar air heater will never turn on. The digital thermostat operates via the solar panel, so there is no need for batteries or AC power.

The solar air heaters work by drawing in air from inside your home and circulating it through a maze of black aluminium that has a special selective coating that absorbs much more heat than it emits. This heated air is then blown into the dwelling via a solar powered fan. This works incredibly well for heating your home in the spring, fall, and winter months and provides an increase of 70-90 F (20-40 C).
