

Rocky Mountain Adhesives

Wet End Technology (WET) Cold Glue System for Case Sealing

FEATURES

Rocky Mountain Adhesive's low-cost **W.E.T.** cold gluing system is ideally suited for the production of case, tray and top sealing in environments that cannot tolerate stops for cleaning and/or have guarded machines. **W.E.T.** keeps the applicator nozzle tip clean and moist during significant downtime intervals.

W.E.T. tip bath level is automatically maintained by a large reservoir located outside the guarded section of the machine for easy maintenance.

W.E.T. cold glue stations are flexible, economical, durable and feature brisk extrusion similar to that of hot melt system. Controls have built in ready/stop modes that automatically raise and lower the application valve. Applicator valves are easy to maintain with few moving parts. Adhesive container changes are simple with a machine or wall mounted pump assembly.

W.E.T. glue station at rest; nozzle is submerged in W.E.T. medium (corn/mineral oil for Dextrin – detergent for PVA)

W.E.T. glue station is active and ready to apply adhesive in 360° single or multi-orifice patterns

TECHNICAL SPECIFICATIONS:

- High-speed gluing at machine speeds in excess of 65 boxes per minute
- Stainless Steel C200 style pneumatic valve for industry compatible fit and form
- Easy to program pattern controller
- "Stitch" and "continuous" pattern capabilities
- Up to 8 pattern segmentations

Rocky Mountain Adhesives offers a full line of cold and hot adhesive application equipment
