

Statement of Shelf Life and Storage Conditions

This statement is regarding the stored conditions of single, double and triple insulated wire using the following materials:

- Tin Plated Copper
- Litz Wire
- ETFE
- FEP
- PFA
- TCA

The recommended shelf life for these products are up to 5 years when stored at 20-25°C, 20-30% relative humidity. When tin plated copper is used, a solder test is always recommended to ensure no oxidization is present before use. It is also recommended that the wire be wrapped in plastic. If a product is over 5 years old, it will require additional testing prior to use. Please contact Rubadue in the event a product is over 5 years prior to use. Please also note that, Rubadue Wire warrants its product one year after the invoice date per our terms and conditions.

Sincerely,

Mike Skorupa
