## EXTERIOR BAHAMA OR BERMUDA STYLE PANELS

They were originally designed for the tropics and are often used for sun screening and moderate storm protection, where one shutter panel will usually cover the entire window. These shutters are hinged at the top of the window and open from the bottom and can be propped open with a support arm for visibility, while blocking out the intense UV sunlight that can damage the integrity of your home's interior, but will allow the soft ambient light and refreshing breezes to pass through. They feature beautiful functionality and authentic Caribbean style with a touch of quaint tropical charm.

Step # 1: Measure the width, then the height you need

Step # 2: What size louver of the 3 available sizes will look best with your home?

Note: All stiles and sub-stiles will be 2" and the panel thickness will be 1-3/8"
